

# Get Those Pigs

## with the Pig Brig® Trap System

(see the User Guide for details)

1.

### GATHER YOUR SUPPLIES

You'll need T-posts, corn, and a few other items to prep the site.

*(See page 4 for complete list)*

2.

### PICK YOUR TRAP SITE

Look for flat ground, tree cover, and hog sign. Avoid wet, muddy spots, or areas with human activity.

3.

### BAIT THE SITE

You'll have better success trapping if the bait is out longer and the pigs are well-conditioned to feeding at your site.

4.

### ASSEMBLE YOUR PIG BRIG TRAP

See User Guide pages 5-19 or watch our videos for step-by-step instructions.

➡ *Flip over this card to get tips for a smooth, successful setup.*

5.

### CONDITION THE PIGS

This crucial step will determine how successful you are at catching the entire sounder. The trap must be set in **Conditioning Mode** (See pages 20-22) until the pigs are comfortable feeding under the net. To do this, partially raise the net off the ground about 12-15". It should touch the pigs' backs when they feed. Bait all around the outside and inside the trap. Allow the pigs to come and go as they please.

6.

### BE PATIENT

Conditioning is necessary for trapping. Some pigs can be conditioned in a few days and others can take a few weeks. Let the pigs get used to the trap and get comfortable feeding under the net. Watch them and judge their behavior. *Pigs are smart, but we like to think we're smarter.*

7.

### ADVANCE TO CAPTURE MODE

After you see the whole group of pigs feeding under the net for 2-3 nights in a row, set your trap in capture mode! (See pages 23-29) Bait the trap heavily (about ~5 lbs/pig). Place the bait in the very center of the trap (away from the net skirt). Now wait for those pigs to come!

8.

### GET 'EM!

Plan to check for pigs at dawn the morning after you drop the net. Gather what you'll need – your coffee, trailer, gun, camera – and go get those pigs!

# Trapping Tips & Tricks

## Trap Setup

*(For detailed instructions, see User Guide pages 5-19)*

- Use 6.5' or 7' T-posts. Use 7 ft. in softer soils. Shorter ones will not work.
- The warning "Danger" sign should always be on the outside of the trap, ensuring the Boar Shield is on the inside.
- Test secured ground anchors by pulling aggressively. They should stay firmly seated when pulled.

## Conditioning Mode

*(For detailed instructions, see User Guide pages 20-22)*

- For the first few nights, spread bait inside and outside of the trap.
- Allow the pigs to get used to feeling the net on their backs by letting parts hang lower (~12-15" off the ground).
- Don't shoot at the pigs, run dogs in the area, or feed them anywhere nearby while trying to trap them.

## Capture Mode

*(For detailed instructions, see User Guide pages 23-29)*

- Short black cam straps come attached to the middle of the net. Each should be secured to corresponding T-posts.
- Make sure the hooked cam straps are super tight and all the corn is in the very center of the trap.
- If your trap site is muddy, toss straw/hay wherever the net will touch the ground when setting the trap.

## The Pigs

- Stay calm when approaching the trap. Let the pigs tire themselves out before taking any shots.
- Aim for the center of the brain and take your time.
- If you plan on loading live pigs into a trailer, see our instructional videos on YouTube or online. Or, reach out to us.
